Knowledge Check

Module 1: Accessibility Overview

Designing and Delivering Accessible Online Courses. Licensed CC BY 4.0.

This is the printable version of the interactive knowledge check on the course website. 5 questions. Circle one answer for each, then check your responses against the answer key at the end.

Questions

1. Which four principles organise the WCAG 2.1 standard?

A. Perceivable, Operable, Understandable, Robust B. Portable, Open, Universal, Readable C. Presentable, Optimised, Usable, Reliable D. Perceivable, Optional, Understandable, Reviewable

2. Roughly what proportion of students has a documented or undocumented disability affecting access to course content?

A. 1 in 4 B. 1 in 40 C. 1 in 100 D. 1 in 12

3. When is the right time to consider accessibility in course design?

A. From the beginning, as a design decision B. After the course is built, as a review step C. Only when a student requests an accommodation D. At the end of the term when there is time

4. A student cannot operate your course with a keyboard alone. Which principle does this fail?

A. Operable B. Perceivable C. Understandable D. Robust

5. Which best describes 'robust' in the POUR framework?

A. Content works reliably with current and future assistive technologies B. Content loads quickly on slow connections C. Content is written in plain language D. Content has high colour contrast

Answer key

1. A, Perceivable, Operable, Understandable, Robust

POUR: Perceivable, Operable, Understandable, Robust. Every success criterion sits under one of these four.

2. A, 1 in 4

About 1 in 4. Many are undocumented, which is why designing accessibly from the start matters more than responding to individual requests.

3. A, From the beginning, as a design decision

Accessibility is a design decision made at the start. Retrofitting is slower, more expensive, and usually incomplete.

4. A, Operable

Operable covers whether a user can navigate and interact, including by keyboard alone.

5. A, Content works reliably with current and future assistive technologies

Robust means content is coded so that a range of user agents and assistive technologies, now and in future, can interpret it reliably.
